

# Mini Polisher Separation Screens

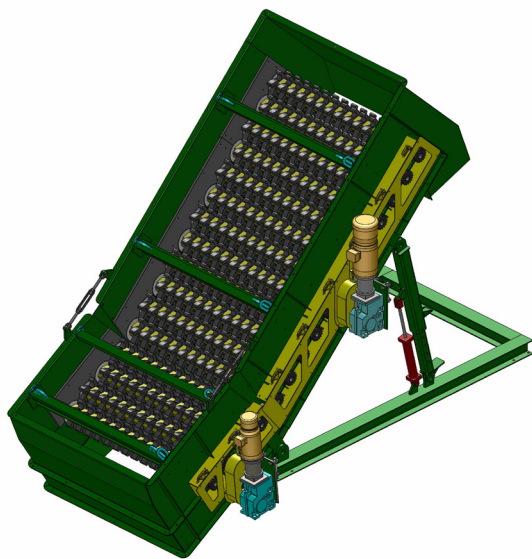

**GREEN SCREENS®** Mini/Mid Sized Single Stream Separation Screens offer most of the same attributes as our famous full size screens. Differences are that these screens process fewer tons per hour, cost less and can be located within an 18' building clear height. GREEN MACHINE® systems utilize these smaller polishers for final removal of flattened containers from the fiber stream but can also be used as a primary separation screen for recyclers running 12 or less tons per hour. Like the full size screening systems, our patented GREEN SCREENS® wrap resistant spacer systems and field adjustable disc spacing, coupled with the industry's lowest per ton rubber disc wear cost, makes GREEN SCREENS® the recycling industry's best performing separation system.
